

AMENDMENTS TO THE SPECIFICATION

Please amend the paragraph beginning on page 7, line 19, as follows:

Referring to FIG. 3, reference number 12 and 14 denotes the first substrate and the second substrate, wherein the first substrate 12 is bottom substrate, and the second substrate 14 is top substrate, and the top substrate 12 and the bottom substrate 14 can be reversed. In the preferred embodiment of the present invention, referring to FIG. 4A, the sealant is dispensed on the periphery region 16 of the bottom substrate 12 by utilizing one-drop fill process. In addition, when the sealant is dispensed on the bottom substrate 12, the liquid crystal (not shown) is formed on the top substrate 14. Further, the corner 18 of the bottom substrate 12 used as the initial point 20 and the ending point 22(as shown in FIG. 5A), when the sealant is dispensed on the surface of bottom substrate 12, wherein the material of the sealant can be acryl resin or epoxy, and the sealant must be an ultra-violet hardened sealant such that the yield of the TFT-LCDs could be maintained. Furthermore, FIG. 4B and FIG. 4C represent the dispensation method for dispensing the sealant on the periphery region 16 of the bottom substrate 12. The initial point 20 and the ending point 22 are the same position on the corner 18 of the bottom substrate 12. Therefore, the initial point 20 and ending point 22 would not contaminate the display region to affect the LCDs quality.
